Keygraph

San Francisco, California
USA

Keygraph builds AI penetration testing for application security teams. The Keygraph platform runs continuous, autonomous pentests against web applications and APIs, so teams can test every release instead of waiting for an annual engagement.Its agents read the source code, map the attack surface, then attempt real exploits against the running application. Only findings backed by a working proof of concept are reported, which cuts false positives and gives teams evidence they can act on and share with auditors.The platform covers whitebox and blackbox pentesting, business logic testing, agentic SAST, SCA with reachability analysis and secrets scanning, with code remediation delivered as reviewable changes. It runs as a cloud service or self-hosted in the customer's own environment.Keygraph also builds Shannon, a leading open-source AI pentester, that matches XBOW and Aikido at a fraction of the cost.
